

HTMLElement.innerHTML

The **innerHTML** property of the [HTMLElement](#) interface represents the rendered text content of a node and its descendants.

As a getter, it approximates the text the user would get if they highlighted the contents of the element with the cursor and then copied it to the clipboard. As a setter this will replace the element's children with the given value, converting any line breaks into [
](#) elements.

Note: `innerHTML` is easily confused with [Node.textContent](#), but there are important differences between the two. Basically, `innerHTML` is aware of the rendered appearance of text, while `textContent` is not.

Value

A string representing the rendered text content of an element.

If the element itself is not [being rendered](#) (for example, is detached from the document or is hidden from view), the returned value is the same as the [Node.textContent](#) property.

Warning: Setting `innerHTML` on a node removes *all* of the node's children and replaces them with a single text node with the given string value.

Examples

This example compares `innerHTML` with [Node.textContent](#). Note how `innerHTML` is aware of things like [
](#) elements, and ignores hidden elements.

HTML

```
<h3>Source element:</h3>
<p id="source">
  <style>
    #source {
      color: red;
    }
    #text {
      text-transform: uppercase;
    }
  </style>
  <span id="text">
    Take a look at<br />
    how this text<br />
    is interpreted below.
  </span>
  <span style="display:none">HIDDEN TEXT</span>
</p>
<h3>Result of textContent:</h3>
```

```
<textarea id="textContentOutput" rows="6" cols="30" readonly>...</textarea>
<h3>Result of innerText:</h3>
<textarea id="innerTextOutput" rows="6" cols="30" readonly>...</textarea>
```

JavaScript

```
const source = document.getElementById("source");
const textContentOutput = document.getElementById("textContentOutput");
const innerTextOutput = document.getElementById("innerTextOutput");

textContentOutput.value = source.textContent;
innerTextOutput.value = source.innerText;
```

Result

Source element:

TAKE A LOOK AT
HOW THIS TEXT
IS INTERPRETED BELOW.

Result of textContent:

#source {
 color: red;
}
#text {

Result of innerText:

TAKE A LOOK AT
HOW THIS TEXT
IS INTERPRETED BELOW.
