Template Literals

So far, you've learned what template literals are and how they compare with regular strings. Now, let's look at some practical examples.

Generating HTML Markup

You will often see template literals used for generating HTML markup. They allow you to embed JavaScript expressions directly into HTML strings. This makes it easy to create content that's dynamic and data driven.

Example:

```
const user = {  
  name: "Marie",  
  age: 25,  
};  
  
const userProfile = `  
<div>  
  <h2>Name: ${user.name}</h2>  
  <p>Age: ${user.age}</p>  
</div>  
`
```

Note how the `${}` syntax allows you to run JavaScript expressions directly within the string. In this case, it's used to read the values of the `user` object's properties.

Creating Dynamic SQL Queries
