Number.prototype.toFixed()

The **toFixed()** method formats a number using fixed-point notation.

Try it

JavaScript Demo: Number.toFixed()

```
1 function financial(x) {  
2   return Number.parseFloat(x).toFixed(2);  
3 }  
4  
5 console.log(financial(123.456));  
6 // expected output: "123.46"  
7  
8 console.log(financial(0.004));  
9 // expected output: "0.00"  
10  
11 console.log(financial('1.23e+5'));  
12 // expected output: "123000.00"  
13
```

Syntax

toFixed()

toFixed(digits)

Parameters

digits Optional

The number of digits to appear after the decimal point; this may be a value between 0 and 20, inclusive, and implementations may optionally support a larger range of values. If this argument is omitted, it is treated as 0.

Return value

A string representing the given number using fixed-point notation.

Exceptions

[RangeError](#)

If **digits** is too small or too large. Values between 0 and 100, inclusive, will not cause a [RangeError](#). Implementations are allowed to support larger and smaller values as chosen.
