String.prototype.includes()

The **includes()** method performs a case-sensitive search to determine whether one string may be found within another string, returning **true** or **false** as appropriate.

Try it

JavaScript Demo: String.includes()

```
1 const sentence = 'The quick brown fox jumps over the lazy dog.';
2
3 const word = 'fox';
4
5 console.log(`The word "${word}" ${sentence.includes(word) ? 'is' : 'is not'}`)
6 // expected output: "The word "fox" is in the sentence"
7
```

Run › Reset

Syntax

includes(searchString)
includes(searchString, position)

Parameters

searchString

A string to be searched for within `str`. Cannot be a regex.

position Optional

The position within the string at which to begin searching for `searchString`. (Defaults to `0`.)

Return value

true if the search string is found anywhere within the given string; otherwise, **false** if not.

Exceptions

[TypeError](#)

If `searchString` [is a regex](#).
