String.prototype.substring()

The **substring()** method returns the part of the `string` between the start and end indexes, or to the end of the string.

Try it

JavaScript Demo: String.substring()

```
1 const str = 'Mozilla';
2
3 console.log(str.substring(1, 3));
4 // expected output: "oz"
5
6 console.log(str.substring(2));
7 // expected output: "zilla"
8
```

Run › Reset

Syntax

```
substring(indexStart)
substring(indexStart, indexEnd)
```

Parameters

indexStart

The index of the first character to include in the returned substring.

indexEnd Optional

The index of the first character to exclude from the returned substring.

Return value

A new string containing the specified part of the given string.

Description

`substring()` extracts characters from `indexStart` up to *but not including* `indexEnd`. In particular:
